Coupled Tanks - Quanser

The Coupled Tanks Apparatus investigates basic and advanced

control engineering principles. This includes the study of static and dynamic systems. It is also an ideal system to use with other control strategies such as fuzzy logic. The CE105 shows fluid transport and liquid level control problems in process control.

The Coupled Tanks system has 4 translucent tanks each with a pressure sensor to measure the water level.

The couplings between the tanks can be modified by the use of seven

manual valves to change the dynamics of the system imposing the use of different controllers. Water is delivered to the tanks by two independently controlled, submersed pumps.

The coupled tank system includes two tanks mounted above a reservoir, which function as a storage for liquid. It has an independent pump to pump liquid from reservoir to tanks. The two tanks are connected in an interactive manner. When two tanks are coupled, the liquid in two tanks interact and

This computer controlled coupled tank system has three tanks. Each water tank is about 5 litre capacity and water level in each tank may be varied

A mathematical model of the coupled-tank system is derived to facilitate a simulation study. Assuming that the water level in the second tank is the only measured state, an extended observer with time-varying parameters estimates the second state and the total disturbances of the system.
