A medical linear accelerator (LINAC) is the device most commonly used for external beam radiation treatments for patients with cancer. It delivers high-energy x-rays or electrons to the region of the patient's tumor. These treatments can be designed in such a way that they destroy the cancer cells while sparing the surrounding normal tissue.

~~A linear particle accelerator is a type of particle accelerator that accelerates charged subatomic particles or ions to a high speed by subjecting them to a series of oscillating electric potentials along a linear beamline. The principles for such machines were proposed by Gustav Ising in 1924, while the first machine that worked was constructed by Rolf Widerøe in 1928 at the RWTH Aachen University. Linacs have many applications: they generate X-rays and high energy electrons for medicinal ...~~

Photon beam radiation therapy is another name for what is usually known as external beam radiation therapy. It uses photon beams to get to the tumor but also can damage healthy tissue around the tumor. Photons are used in treatments that are given by a machine called a linear accelerator. The photon beams are invisible and cannot be felt when they are passing through the skin to the cancer.

~~Getting External Beam Radiation Therapy~~

Linear accelerators have been used to treat cancer since the 1950s. There are different types of LINAC machines, but they all have one thing in common. They send radiation, such as X-rays or electron beams, through your body and into your tumor. This is known as "external beam radiation."
