Finally, a curriculum that promotes academic excellence and personal safety, while giving students the skills to make connections that matter! Based on the #1 New York Times bestseller The 5 Love Languages®, this curriculum uses research-based techniques that will help teachers and students establish both human and academic connections. Eight easy-to-use lessons written in both scripted and abbreviated formats (average time per lesson: 35 minutes) Curriculum that reaches all elementary-aged students, including trauma-sensitive, complex, and highly capable learners Academic Focus Pages™ written at age-appropriate levels. Students can use them during the lesson and the classroom teacher can reproduce them year after year Tools and ideas for all staff members to create an overall school climate of acceptance and break down walls of diversity

In this book, master teacher, trainer, and celebrated math author Becky Bride will show you step-by-step, activity-by-activity, and lesson-by-lesson how she used cooperative learning structures to help her students succeed with algebra year after year. When the power of student-to-student interaction is unleashed in algebra, students enjoy learning more and the abstract algebraic concepts become more concrete and understandable.

A new textbook designed for complete coverage of the New York State Core Curriculum for Integrated Algebra.

This book constitutes an introduction to the theory of binary switching networks (binary logic circuits) such as are encountered in industrial automatic systems, in communications networks and, more particularly, in digital computers. These logic circuits, with or without memory, (sequential circuits, combinational circuits) play an increasing part in many sectors of industry. They are, naturally, to be found in digital computers where, by means of an assembly (often complex) of elementary circuits, the functions of computation and decision which are basic to the treatment of information, are performed. In their turn these computers form the heart of an increasing number of digital systems to which they are coupled by interface units which, themselves, fulfil complex functions of information processing. Thus the digital techniques penetrate ever more deeply into industrial and scientific activities in the form of systems with varying degrees of specialization, from the wired-in device with fixed structure to those systems centered on a general-purpose programmable computer. In addition, the present possibility of mass producing microminiature sized logic circuits (integrated circuits, etc.) gives a foretaste of the introduction of these techniques into the more familiar aspects of everyday life. The present work is devoted to an exposition of the algebraic techniques necessary for the study and synthesis of such logic networks. No previous knowledge of this field of activity is necessary: any technician or engineer possessing an elementary knowledge of mathematics and electronics can undertake its reading.

Students learn about important subjects by relating them to events and things that occur in their everyday lives. A wealth of interesting activities provide a detailed look into each subject. Easy-to-use activities can be completed individually at school or at home, though a few hands-on experiments require group work and data sharing. A great supplement to any existing curriculum! When students see the important role math plays in their everyday lives, it becomes more interesting and meaningful. A variety of activities enable all students to find a particular math concept or activity at which they can succeed!
