Meanwhile, NHS Scotland has had a core set of continuous quality improvement indicators (CQIs) for nursing relating to food, fluid and nutrition, falls and pressure area care since 2008. These indicators are complemented by the 'ward profile' and are being built on to support the measurement of caring behaviours and patient experience.

Nursing dashboards - measuring quality

Nursing-sensitive indicators identify structures of care and care processes, both of which in turn influence care outcomes. Nursing-sensitive indicators are distinct and specific to nursing, and differ from medical indicators of care quality. For example, one structural nursing indicator is nursing care hours provided per patient day.

Nursing Sensitive Indicators Nursing-sensitive indicators can be an important tool in identifying patient care issues that could potentially arise during a hospital stay. By analyzing the data on specific nursing-sensitive indicators, the quality of patient care can be optimized and patient satisfaction can be improved.

In this era of patient safety, quality indicators associated with the nursing profession have evolved from nursing-sensitive to adverse event sensitive. This paper aims to compare and contrast available quality indicator tools associated with nurse staffing outcomes. Methods: We conducted a systematic review of literature from the past 6 years, identifying research and/or monitoring efforts reporting structure, process, and/or outcomes measures associated with nursing care. Twenty-four articles were selected, and identified indicators from the National Quality Forum were compared/contrasted with relevant AHRQ Patient Safety Indicators. Results: The results of this study provide an important comparative assessment of the types, content, and intended purpose of available nursing indicators. We found little overlap and direction in the types of indicators available to examine the influence of nurse staffing on the outcomes of care. Further, there are no process measures available. The need for consistent indicator definitions and process measures is addressed.

"Nurses play a vital role in improving the safety and quality of patient care -- not only in the hospital or ambulatory treatment facility, but also of community-based care and the care performed by family members. Nurses need know what proven techniques and interventions they can use to enhance patient

outcomes. To address this need, the Agency for Healthcare Research and Quality (AHRQ), with additional funding from the Robert Wood Johnson Foundation, has prepared this comprehensive, 1,400-page, handbook for nurses on patient safety and quality -- Patient Safety and Quality: An Evidence-Based Handbook for Nurses. (AHRQ Publication No. 08-0043)."--Online AHRQ blurb, <http://www.ahrq.gov/qual/nursesfdbk>.

"This literature review uses and analyzes nursing-sensitive indicators for community-based nonacute care. Seeking evidence-based indicators that reflect the quality of nursing care, an ANA advisory committee determined that the indicators as a set should include measures of structure, nursing process, and client/patient outcomes with a strong relationship to nursing care. The resulting community-based nonacute care indicators are pain management; consistency of communication; staff mix; client/patient satisfaction; tobacco use prevention; cardiovascular disease prevention; care giver activity; identification of primary care giver; activities of daily living; and psychosocial interaction." -- Cover page 4.

physical edition. Nursing Outcomes: State of the Science is an invaluable resource for nurse researchers, scholars, and health care professionals committed to effective, quality nursing care as evidenced by nursing-sensitive outcomes measurement. This text concentrates on outcome indicators which focus on how patients and their conditions are affected by their interaction with nursing staff. Each chapter includes a concept analysis of the outcome concept; then defining characteristics are identified and a conceptual definition is proposed. Factors that influence the outcome concept are discussed, as well as the consequences for clients' health and well-being. The strength of the evidence is reviewed concerning the sensitivity of the outcome concept to nursing structure variables and nursing/processes interventions. The author offers a comprehensive synthesis of the literature, critically reviews the quality of the evidence, and provides direction for the selection of outcome variables

The federal government operates six major health care programs that serve nearly 100 million Americans. Collectively, these programs significantly influence how health care is provided by the private sector. Leadership by Example explores how the federal government can leverage its unique position as regulator, purchaser, provider, and research sponsor to improve care - not only in these six programs but also throughout the nation's health care system. The book describes the federal programs and the populations they serve: Medicare (elderly), Medicaid (low income), SCHIP (children), VHA (veterans), TRICARE (individuals in the military and their dependents), and IHS (native Americans). It then examines the steps each program takes to assure and improve safety and quality of care. The Institute of Medicine proposes a national quality enhancement strategy focused on performance measurement of clinical quality and patient perceptions of care. The discussion on which this book focuses includes recommendations for developing and pilot-testing performance measures, creating an information infrastructure for comparing performance and disseminating results, and more. Leadership by Example also includes a proposed research agenda to support quality enhancement. The third in the series of books from the Quality of Health Care in America project, this well-targeted volume will be important to all readers of To Err Is Human and Crossing the Quality Chasm - as well as new readers interested in the federal government's role in health care.
