A synthesis reaction or direct combination reaction is one of the most common types of chemical reaction. In a synthesis reaction, two or more chemical species combine to form a more complex product: A + B → AB. In this form, a synthesis reaction is easy to recognize because you have more reactants than products.

The ultraviolet radiation in sunlight has both positive and negative health effects, as it is both a principal source of vitamin D 3 and a mutagen. A dietary supplement can supply vitamin D without this mutagenic effect. Vitamin D has been suggested as having a wide range of positive health effects, which include strengthening bones and possibly inhibiting the growth of some cancers.

Sometimes the wording of your assignment will direct you to what sorts of themes or traits you should look for in your synthesis. At other times, though, you may be assigned two or more sources and told to synthesize them. In such cases you need to formulate your own purpose, and develop your own perspectives and interpretations.

Guanine-sensitive and dependent type 1 poliovirus was studied in KB cells. The pattern of production of viral RNA and virions was determined by following the incorporation of uridine 3H into-cells pretreated with actinomycin D. RNA appeared about 2 hours after infection and increased exponentially; virions appeared at 4 hours. The addition of M/50 semicarbazide increased viral RNA production,...
